

EXHIBIT A

Pursuant to 37 C.F.R. § 1.121, a marked-up version of the amendments is as follows:

Please amend claims 22, 29, 39 and 41 as follows:

22. (Twice Amended) A stereographic device comprising:

a content support portion, a handheld stereoscopic viewer, and a viewer pivotal chassis;

the content support portion being configured to position and support textual, stereographic, and immersive content;

the content support portion being proportioned to convey, when said content support portion occupies a full field of view of the viewer when said viewer is at a position of focalization, content which is configured to convey four visual fields, including a left peripheral monocular field, a left binocular stereo field, a right binocular stereo field, and a right peripheral monocular field, respectively;

the viewer being configured to enable interocular adjustment, including adjustable left and right lenses and adjustable occluding apertures configured to enable the right binocular stereo field and the right peripheral monocular field to be occluded from the left eye viewpoint and left binocular stereo field and the left peripheral monocular field to be occluded from the right eye viewpoint, respectively;

said adjustable lenses and occluding apertures configured to facilitate interpupillary alignment with said content, to thereby enable fusion of the content of the left binocular stereo field with the content of the right binocular stereo field, to thus enable perception of a central binocular stereo field of three dimensional content, and with alignment of the respective occluding apertures, to also enable perception of the left and right peripheral monocular fields of two dimensional content, so that the full field of view, as perceived after fusion, consists of three fields of content including the left and right peripheral monocular fields of two dimensional content interposed by the central binocular stereo field of three dimensional content;

the viewer pivotal chassis being compatibly configured with said viewer and said content support portion to enable the viewer pivotal chassis to couple to said viewer and said content support portion so that the viewer pivotal chassis is interposed between said viewer and said content support portion;

the viewer pivotal chassis being configured to enable said viewer to be positioned in alignment with said content support portion and said content to facilitate perception of said content;

the viewer pivotal chassis including a plurality of pivotal axes parallel to a line which bisects the left and right lenses of said viewer, said axes being configured to enable a distance between said viewer and said content to be adjustable, so as to facilitate focalization; and

said viewer pivotal chassis axes also being configured to enable said viewer to function and be moveable in a plane that is parallel to a plane common to the surface of said content so that said content is visually scannable with said viewer by moving said viewer in said plane up and down a length of said content while maintaining focus during movement of the viewer relative to the content to facilitate focalized optical conveyance of content having an image area greater in its entirety than is optically accessible with the viewer at one time.

29. (Amended) A variation of the content support portion of the device of claim 22, wherein said content support portion is configured to provide a rigid, generally planar surface to position, support in a generally common plane and releasably attach [, in a manner similar to a clipboard,] at least one surface of a page provided with said content, to enable said content to be positioned to be optically conveyed and visually scanned with said viewer while maintaining focus.

39. (Twice Amended) A stereographic device comprising:

a content support portion having stereographic content which includes a left peripheral monocular field, a left binocular stereo field, a right binocular stereo field, and a right peripheral monocular field;

a stereoscopic viewer including adjustable left and right lenses and left and right adjustable occluding apertures associated with the left and right lenses, respectively, the viewer being configured so that content of the left binocular stereo field is visually merged with content of the right binocular stereo field to enable perception of three fields of content including the left and right peripheral monocular fields of two dimensional content and a central binocular stereo field of three dimensional content located therebetween, the left and right occluding apertures each being located in a common plane and being movable in the common plane to adjust the locations of the left and right occluding apertures; and

a viewer pivotal chassis configured to couple the viewer to the content support portion.

41. (Amended) [The apparatus of claim 39, wherein] A stereographic device comprising:

a content support portion having stereographic content which includes a left peripheral monocular field, a left binocular stereo field, a right binocular stereo field, and a right peripheral monocular field;

a stereoscopic viewer including adjustable left and right lenses and left and right adjustable occluding apertures associated with the left and right lenses, respectively, the viewer being configured so that content of the left binocular stereo field is visually merged with content of the right binocular stereo field to enable perception of three fields of content including the left and right peripheral monocular fields of two dimensional content and a central binocular stereo field of three dimensional content located therebetween, the adjustable left and right lenses [are] being integrally formed with the left and right occluding apertures, respectively, so that adjustment of said left and right lenses causes a corresponding adjustment of the left and right occluding apertures, respectively; and

a viewer pivotal chassis configured to couple the viewer to the content support portion.
